[www.neovendi.com](http://www.neovendi.com)

Hello, I am Neovendi.  
I would like to introduce myself.

We, at Neovendi GmbH, are active as a management consultancy and service provider for the developmental support of digital control and safety technology in international rail traffic. Our areas of expertise are systems engineering, qualification management, method and process consulting as well as research and development projects. We develop, manage and qualify the modern mobility of the future and thus make our active contribution to the optimization of modern traffic and mobility concepts.

## Topics

That's how we support digital transformation.

# This is how we support the digital transformation.

Technological innovations and Employee development go hand in hand:

## develop.

### Innovative transport services of the future

Modern mobility is based on the interoperable idea. Smart and efficient use of existing data and the provision and generation of new mobility data form one of the central tasks of our development work.

### Digital control, command and signaling

The future of the rail network will be shaped by the digital interlocking system (DSTW). It forms the basis for greater reliability and economic efficiency as well as for modern rail operations with significantly higher capacities.

### Mobile communication standard

A transition to the new radio standard FRMCS (Future Railway Communication System) enables a variety of new applications and contributes to the goals of increased capacity and more punctuality. Through our active participation in projects for technical and economic solutions, we offer guidance on the migration path from old to new.

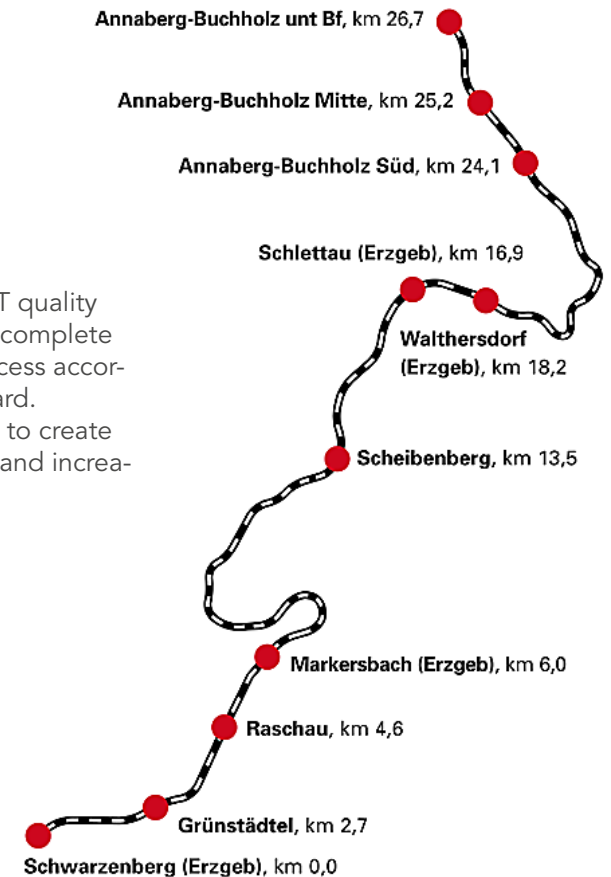

### Automatic Train Operation (ATO)

Safety, efficiency and sustainability are a particular focus in the development of autonomous driving. To support ATO, new mobile communications standards for railroads are needed so that data based on these values and in real time for this purpose are available. All results of our work in the ATO projects for autonomous trains (WP1 to WP5) with TAURO (Technologies for the Autonomous Rail Operation) are applied in „Europe’s Rail“.

### Software development

In the field of testing and IT quality assurance, we support the complete software development process according to the ISTQB® standard. The primary goals here are to create transparency, acceleration and increased efficiency.

## Our special areas

- \* EULYNX is an initiative of the European railroad infrastructure operators.
- \* Europe's Rail is a JU made up of the EU, the European Rail Infrastructure Operators and the rail industry.
- \* OCORA (Open CCS On-board Reference Architecture)
- \* Shift2Rail is a European initiative for the development of modern rail operations.
- \* Linx4Rail is a project within Shift2Rail.

### EULYNX interface standardization

The European digitization initiative EULYNX defines and standardizes the interlocking interfaces of the future digital control, command and signaling (CCS). Through our activity in the EULYNX initiative, we support the expectations of politics and society by making our contribution to climate protection, improving punctuality, and promoting interoperability.

develop. manage. qualify.

## EULYNX & MBSE System Engineering

### Package 1 – Trainings

5 days training with theory & practice

- General goals of the training
- Learning objectives of the training
- Day 1:** Introduction to MBSE, ARCADIA, Capella
- Day 2:** Demonstration of ARCADIA and Capella Exercise
- Day 3:** SysML™, EULYNX MBSE HandsON Windchill® Modeler – Teil 1
- Day 4:** EULYNX MBSE HandsON Windchill® Modeler – Teil 2
- Day 5:** Formal Methods

### Package 2 - Development Clusters

Interoperability in each country across Europe Objectives:

#### Objectives:

- take into account the different country-specific requirements
- create new formal models and integrate them into the new EULYNX Baseline documents.

### Package 4 – Tenders

Security in the requirements needed

- Functional performance descriptions
- Tender specifications
- Prequalifications

### Package 3 – EULYNX Baseline Doc.

- What is important for your own product development?
- What information can be found where?
- How to interpret and use the EULYNX baseline documents, files and information?
- Where are the differences in the provided information?
- Which tools / programs are needed?
- How are the interfaces, protocols and subsystems used?
- What is the current status of EULYNX development?

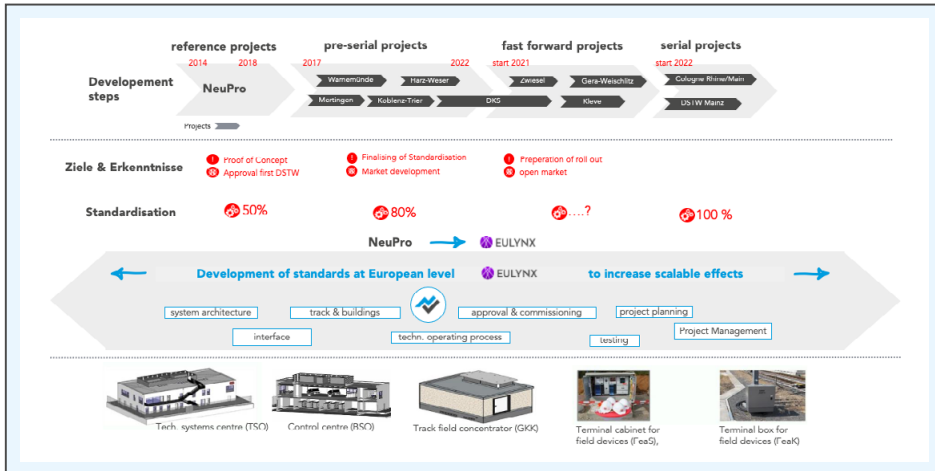

### Package 5 – Engineering

Accompany the process and improve certainty of action

- Practical guidance and support
- Engineering performance with MBSE techniques in the implementation and application of EULYNX requirements
- Direct web reference to the customer product
- Safety
- Cost efficient development
- Acceleration of product development
- Application of tools & methodologies
- Know-How Transfer

### Technical project management

Digitalization of the rail infrastructure will enable unused capacities to be utilized in the future. The technological leap is an important component for more flexible and capacity-optimized driving. Our expertise here is primarily operational project control as well as supplementary consulting services in project management.

### International cooperation

With our activities in qualification and prequalification tasks for digital control, command and signaling (CCS), we support international rail infrastructure companies in fulfilling the requirements as a supplier in the area of the new CCS for Germany.

### Support in the planning of training and data centers

In the development and planning of technical and operating sites, data centers as well as training sites and their facilities, we provide significant support in project development as well as in process support. Interface management also plays a central role here. The professional coordination of various trades is the basis for the successful implementation of these demanding construction projects.

Solve problems.  
sustainable. competent.

## manage.

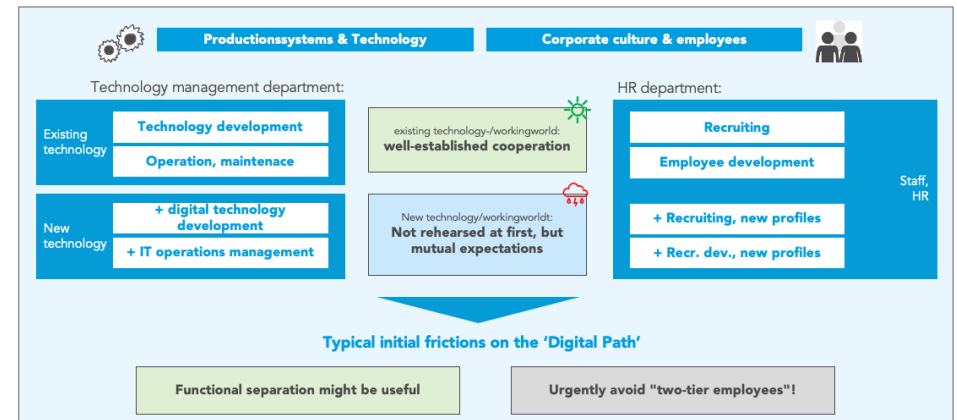

### European Train Control System (ETCS)

In the design of the new interoperable rail operational systems, a particular focus is on the networking of the whole of Europe. Thanks to the

valuable diversity of experience from the „old“ and the „new railroad world“ in our teams, we are working in an interdisciplinary manner on the common, overarching goal.

Many of our projects and development work are directly related to ETCS developments. The main focus of our activities is on modern railroad operational systems, the development of specifications of signaling products or the consulting of development and approval processes according to CENELEC standard EN50126, EIGV, VV-GluV or risk management procedures according to CSM-VO.

## Good ideas are born in dialog.

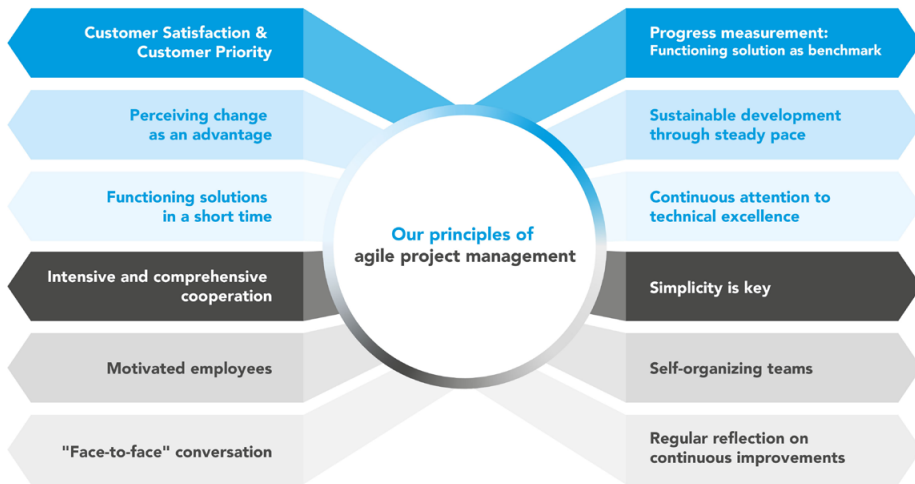

### Interaction of business units in the digital transformation

Today, a cooperative network with creative conversations is one of the foundations for the development and promotion of new and existing technologies. The dialog must be constantly expanded and stimulated with new approaches. For this connection, we are an important interface for the promotion of modern, sustainable and intelligent mobility. We support our customers in recognizing the connections between technology and human resources management in good time and transforming them into successful digitization management - that's what we call „Digital Transformation!“.

### Projekt Management (PMO, PS)

With our work in various projects in the areas of ETCS, CCS, DSTW, and EULYNX, we pursue the goal of supporting the acceleration of projects and passing on our experience through know-how transfer and „best practice“ solutions. Our experience and knowledge are related to the coordination, control, management and review of the projects. The focus of our work is our customer with his requirements and wishes, which we integrate and implement appropriately for the success of the project.

flexible.  
open.  
communicative.

### Module plans (PMO, PS)

Our module plans serve as a planning and implementation tool for particularly complex project plans. In our national and international projects, this tool is used as an important aid in project control. In contrast to traditional project management tools, module plans not only analyze the chronological course of the project, but also focus in particular on the content-related challenges and that in great detail. The starting point is always a detailed definition of objectives.

# qualify.

## Model-based Systems Engineering (MBSE)

The training is specifically designed to provide a basic understanding of the general concepts of MBSE and how these concepts can be applied in various railroad projects. With our basic training on the structure and use of formal systems as well as their tools, we teach the three pillars of model-based systems engineering. We train how to recognize the difference between specific and generic methodology and how to correctly interpret an MBSE specification. In addition, we explain verification and validation techniques as an important part of the MBSE process to increase reliability and efficiency.

MBSE in the ERJU System Pillar:  
The training also introduces the ARCADIA- methodology and its principles.

## 5 days training with theory & practice

Our 5 packages on EULYNX and MBSE on page 9

### General objective

By attending this training, participants will be able to list the three pillars of MBSE (tools, language and methodology) with correct explanation, identify the difference between specific and generic methodology of MBSE approach and relate the general concepts of MBSE applied in specific railroad projects. Participants will learn to correctly interpret an MBSE specification, successfully apply modeling concepts using a tool, and explain the know-how of verification and validation techniques as part of the MBSE process.

### Themenschwerpunkte

- Day 1** – Introduction to MBSE, ARCADIA, Capella
- Day 2** – Demonstration of ARCADIA and Capella Exercise
- Day 3** – SysML™, EULYNX MBSE HandsON Windchill® Modeler – Teil 1
- Day 4** – EULYNX MBSE HandsON Windchill® Modeler – Teil 2
- Day 5** – Formal Methods

### MBSE: Trainings-Roadmap

\* EULYNX is an initiative of the European railroad infrastructure operators.  
 \* ARCADIA (Architecture Analysis and Design Integrated Approach) is a method for system analysis.  
 \* Capella is a trademark of the Eclipse Foundation.  
 \* SysML™ (System Modeling Language) is a graphical modeling language.  
 \* PTC windchill® modeler is a trademark of Parametric Technology GmbH for system specification.

### Control, command and signaling (CCS)

With our activities in qualification and prequalification tasks for the digital control, command and signaling (CCS) we support international railroad infrastructure companies and interlocking suppliers to meet the requirements as a supplier in the field of the new CCS and MBSE applications (EULYNX) for the standardization of national interface methodology and harmonization according to European requirements.

Bringing people together.  
networking technologies.

### Other training topics:

Training programs on behalf of customers

Planning and moderation of workshops and seminars on behalf of customers
